

RECON & THE RECON SUITE

JAMF
software

Recon is a client application that completes its inventory in 45 seconds.

**No more clipboards.
No more hand cramps.**

This application gathers an accurate inventory of all network devices and computers, including Mac OS 9, Mac OS X, and Windows machines. Every application, font, plug-in, peripheral, and device on the network is documented and communicated to the JAMF Software Server (JSS). It also logs MAC addresses, serial numbers, purchasing information, and allows IT to associate employees with computers by entering a small amount of personal data.

In a larger environment, Active Directory or Open Directory can be used to help associate personal information with computers. If the organization is struggling with unauthorized software, Recon will find it in any directory on the computer. Recon uses no computer or network resources until it delivers information to the JSS based on the schedule created by the IT department. After delivering its information, Recon sits dormant until the next execution time, sparing the CPU from background processors and the network unnecessary traffic. This robust inventory capability delivers both the big picture and the granular detail needed to inform IT and business decisions. As the piece that lays the groundwork for a managed environment, Recon is an integral part of the Casper Suite.

The Recon Suite is also available as independent applications for organizations grappling with inventory and asset management challenges. The Recon Suite includes Recon and the JSS and is an effective introduction to the world of client management, solving immediate problems while providing a framework for additional functionalities of life cycle management in the future. The Recon Suite works cross platform, reporting on both Macintosh and Windows machines and building a comprehensive database of all these assets.

FEATURES IN 5.1

- New reporting framework and built-in PDF reports
- License management and reporting
- Network discovery and self-updating based on subnet (Mac OS only)
- Greater scalability

REQUIREMENTS

Mac OS: 8.6, 9, 10.2, 10.3, 10.4, 10.5

Windows: NT4, 2000/2003 Professional

The Recon Suite: an independent, cross platform inventory solution for your entire network.

- Casper uses a MySQL database, just one of the many industry standards in the Casper Suite. Custom scripts can be run against the database at any point for easy export to third party systems or in-house applications.
- Inventory covers Mac OS 9, X and Windows 98, NT 2000, and XP 2003. Machines running any other OS, such as Solaris or RedHat, can be added to the database manually for asset tracking purposes.
- Inventory scans of both hardware and software can be automated. Recon uses SSH to perform remote scans of hardware and software. If SSH is not enabled on the client machines, Composer will create a 'QuickAdd' package for you that will run an inventory scan and that can enable SSH.
- The Casper Suite is broadly scalable, working across 10 to 100,000 client workstations.
- Recon and the Casper Suite have built in reporting that can be exported into a txt, csv, xml, pdf, or customized jsp file that can include your company logo.
